```

Dans ce programme quand on l'éxecute il affiche le message suivant : erreur d'allocation de mémoire cette saturation de mémoire se produit après que le programme a alloué progressivement un nombre croissant de paramètres selon le tableau que j'ai fait dans le code et le message affiché c'est à cause de manque de mémoire disponible .Par contre à chaque fois on va trouver un nombre différent de paramètre car chaque machine a une quantité limité de mémoire vive (RAM) parce que lorsque cette limite est atteinte aucune nouvelle allocation ne peut être effectué donc les résultats dépendent fortement de la quantité de RAM installée.
